3. Group Project

This practical task will be a longer work carried out throughout the whole semester. In the first three weeks you should think about a practical problem you would like to tackle with Deep Learning technologies. Later, you will develop a baseline system and then apply better and more advanced methods throughout the semester. You are welcome to use the computational resources of the MindGarage to develop your project. You should have at least three group meetings with Marcus where you discuss about your task and ideas throughout the semester.

The first meeting should be within the next three weeks. You should set up a meeting with Marcus according to his schedule (more schedule information will be released soon).
